Q10011602 - Is there any Red Hat Enterprise Linux 6.7 UEFI booting issue on x86, AMD64, and Intel 64 Systems?

Red Hat Enterprise Linux 6.7 does not support UEFI for 32-bit x86 systems. On 64-bit systems, boot configurations of UEFI and legacy BIOS differ significantly from each other. Therefore, the installed system must boot using the same firmware that was used during installation. You cannot install the operating system on a system that uses legacy BIOS and then boot this installation on a system that uses UEFI.
