

Q10011310 - In some of the newer cards there is a function to flag a drive as not failed, is that possible for ARC-1280 card?

This feature is for new version firmware to log failed drives. Activate a failed drive feature is necessary to be able to reuse this failed drive. Phased out cards firmware does not log failed drive that you do not need to activate it. We are no longer maintained old RAID adapter's firmware since version 1.49.

Unique solution ID: #1285
