

Q10011403 - Do you add one volume for one key file to enhance multiple volumes for one key (currently CLI) when you have multiple volumes on the RAID controller?

In the currently implementation, the key file will include all encrypted volume on the controller; each one has one individual key in the key file. If you have three encrypted volumes, the key file will include three keys. Latest cli available on site is 1.13.0 and it has included "vsf genkey2" command. "vsf genkey2" will generate key file(s) by volumeset and the file name is the same as the volume set name.
