2018 to 2020

Q10051111- Is there any way to load the Arc-1880 driver module from a Debian 6 boot media.

User can not add a 3rd party driver package while Debian installation, this system has no such option to allow user install additional driver package while installation. If you are well known on linux, you can manually install a pre-compiled driver module through terminal console and remake the ramdisk after installation completed. These procedures need good knowledge on linux and some prepare procedures such as compile driver before installation.

Another solution is installing Debian into a separate drive connected on motherboard, install controller driver after OS installation completed, then clone this OS image into controller volume by dd command.

Unique solution ID: #1431
