

Q10071012 - We are setting up some systems here using the ASUS KGPE-D16 motherboard with dual AMD 6128 AMD Magny-Cours and 16GB of memory (4 X Apacer 4GB DIMMs), and are seeing a problem with the ARC-1261ML controller card. The ARC-1261 is hanging when I try and go into the BIOS and create a RAID set.

ASUS have new firmware V06060 to solve this issue.

Unique solution ID: #1469
