

2012 to 2013

Q10031210 - I want to Install VMware 5.1 on a SM 6027B-URF. The boot CD does not recognize any disks after Raidset and volume set on the ARC-1222.

VMware does not install system into raid card if it has no building driver support. If you are partner of VMware, you can make a customize CD by the develop utility they provided. This develop utility allows you add drivers into the installation CD then you will be able to install system into raid card with this customize CD.
