

2009 to 2011

Q10101001 - I have the ARC-1220 card and I was wondering if it worked correctly with Western Digital's new Advanced Format drives? The ones use 4 Kilobyte sectors instead of 512 Byte.

These 4KB drives have same behavior like common 512B one, so there have no special settings needed for controller to be able to works with them. But as we known, these 4KB drives are desktop drives which may not reliable enough for array applications, and also have no good performance. So both hard drive vendors and us do not suggest customers use this drive for array applications.
