Q10031108 – Is it at all possible to have smartctl support for your newer SAS RAID controllers (like you have for the SATA models)?

For Areca SAS RAID controller without expander such as ARC-12x2 series, you can directly use the currently smartctl tools after you update the firmware.
You can also use the attachment version CLI V1.85_110809 to get the SMART information.
For SAS RAID controller with expander, you can add the patch to compile
the smartctl tools to get the SMART information after you update the firmware.
We have informed the smartctl tools to include the patch on its next release version.
