Q10081503 - When user inserts multiple RAID adapters in a server, Archttp display same name “ARC-xxxx Web Management” for different devices. User confuses to choose any storage through Archttp to administrate those different storages.

In the SNMP configuration page, there have two OIDs called sysName and sysLocation which allows user to identify this card. User can enter the controller identification on the “sysName” and “sysLocation” of “SNMP System Configurations”. From Archttp version 2.4.5, it will use these two OIDs (if existed) to replace the “ARC-xxxx Web Management” for easy identification.

Unique solution ID: #1065
