

Q80011811 - I have a Mac Pro 2013 8-core 3 GHz dual D700 GPU computer with TB2 ports. I have the new Areca 8050T3 6-drive RAID attached. When the computer is put into sleep mode, the Areca RAID keeps turning on.

Storage could be woke up by background services even when the mac under sleep mode. Your system may have storage monitoring tool or synchronize tool which will wake up the array repeatedly. There had iStat Menus running. Customer has turned it off and so far it doesn't seem to be waking up the RAID.
